I just finished building my first website using ReactJS! To make it prettier, I asked my trustworthy AI assistant to edit the UI, but it seems to have accidentally exposed something it shouldn't have...

Thankfully, I always use encrypted flags.. and no one knows my favorite number, right? 😊

[View Hint](#)

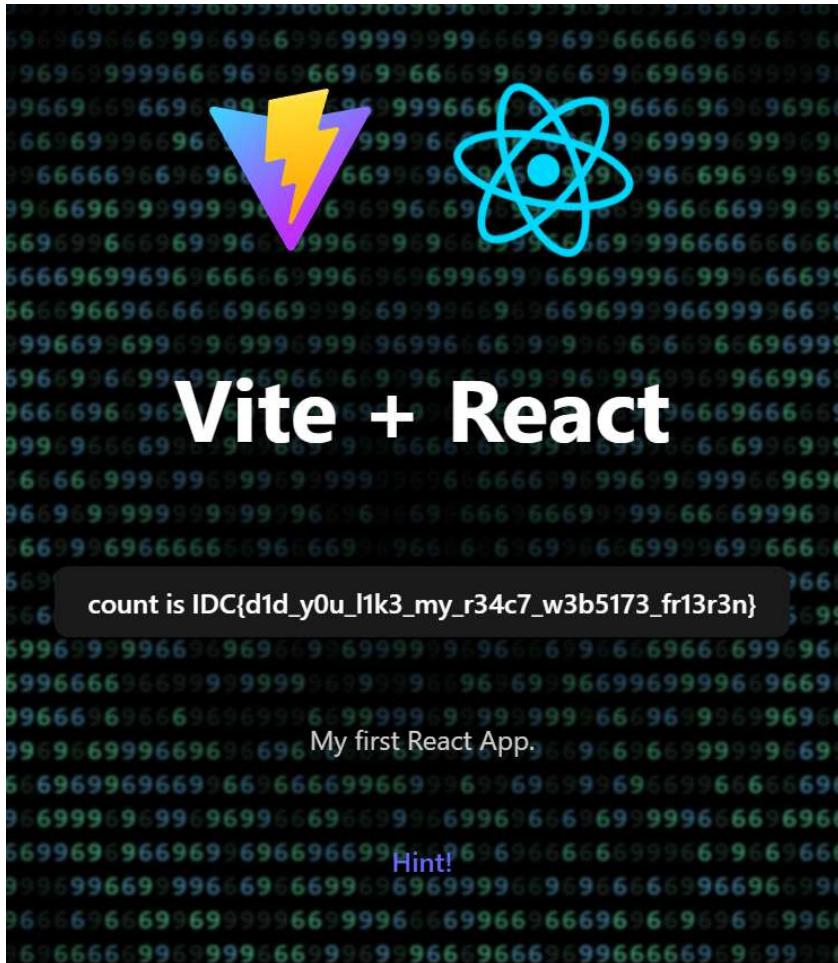

STEP BY STEP SOLUTION

On opening the website we see a simple button and on pressing it the count increases. This button interests me a lot so I decided to press it a 10000 times. And I made my browser do it for me by using this small javascript code snippet in the console:

```
const button = document.querySelector('button');
let count = 0;
const interval = setInterval(() => {
  if (count >= 10000) {
    clearInterval(interval);
```

```
    } else {
        button.click();
        count++;
    }
}, 1);
```

But on the 1000th click of the button, all of a sudden. we see this:

Thus the flag is IDC{d1d_y0u_l1k3_my_r34c7_w3b5173_fr13r3n}

FLAG: IDC{d1d_y0u_l1k3_my_r34c7_w3b5173_fr13r3n}
